

## Tutorial Create Repository

1. Login with your GitHub account, then go to this link <https://github.com/>. Click **New Repository** button on the left side.

Or click “+” at the upper right corner and then click **New repository**.

2. Give a relevant name for the repository. For this case, use os172 as a repository name. Select **Public** and checklist on **Initialize this repository with a README** (you must at least have this file generated on this repository). Then, click on the button **Create repository**.

Create a new repository

A repository contains all the files for your project, including the revision history.

Owner: ostutorial172

Repository name: os172

Great repository names are short and memorable. Need inspiration? How about super-duper-octo-barnacle.

Description (optional)

☒ Public  
Anyone can see this repository. You choose who can commit.

☐ Private  
You choose who can see and commit to this repository.

☒ Initialize this repository with a README  
This will let you immediately clone the repository to your computer. Skip this step if you're importing an existing repository.

Add .gitignore: None

Add a license: None

Create repository

3. The new repository has been successfully created.
